2 Overview

The car wash simulation system aims to model and analyze the operation of a multi-bay car wash facility. It simulates the arrival of customers, their interactions with different wash bays, and the overall performance of the system, utilizing various random number generators. It has a couple of options that make each simulation varied, and parameters like the number of washbays to simulate in any car wash, the number of customers, and even the type of random number generation used. Here are the key points:

Purpose:

The system helps car wash owners and managers understand how different factors (such as service times, arrival rates, and queue management) impact efficiency and customer experience.

By simulating various scenarios, we can optimize resource allocation, reduce wait times, and enhance overall service quality. Managers could get a rough idea how much each of their customers have to wait, and will allow them to assess the viability of adding more washbays in the future, identify the bottle necks, and explore different options for their queuing system that might result in an increase in customer satisfaction.

Components:

1. Customers: Represented by arrival times, service types, and interarrival times.
2. Wash Bays: Each washbay can only service one customer at any given time
3. Random Number Generators: Used for generating arrival times, service times. The three options are `LCG` (Linear Congruential generator), `uniform` (Uniform Number Generator), and `randi` (the inbuilt random number generator function provided by octave, which specifically generates integer values)
4. Metrics: We track system time, queue time, and other performance indicators, as well as aggregate information like the mean queue time, mean system time, which washbays took the longest, etc.

Simulation Process:

1. Manager inputs the various parameters like the number of customers, washbays, and the method by which random numbers should be generated in the simulation.
2. The Interrival Distribution table as well as the washbay distribution tables are generated for each washbay
3. Random number generated which will be mapped to the the interarrival time (checked against the interarrival table)
4. Each customer that comes is assigned a washbay based on whichever one will empty up soonest or is already available
5. Service times are calculated, time in queue, time in system are all calculated and updated

Simulation Process:

Extra features:

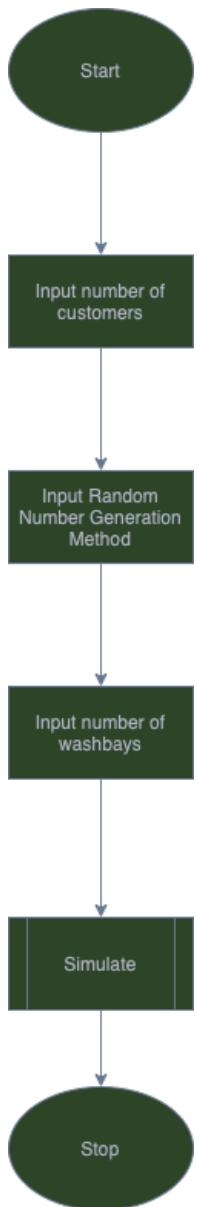

- Managers can select the number of washbays to generate

Project Structure

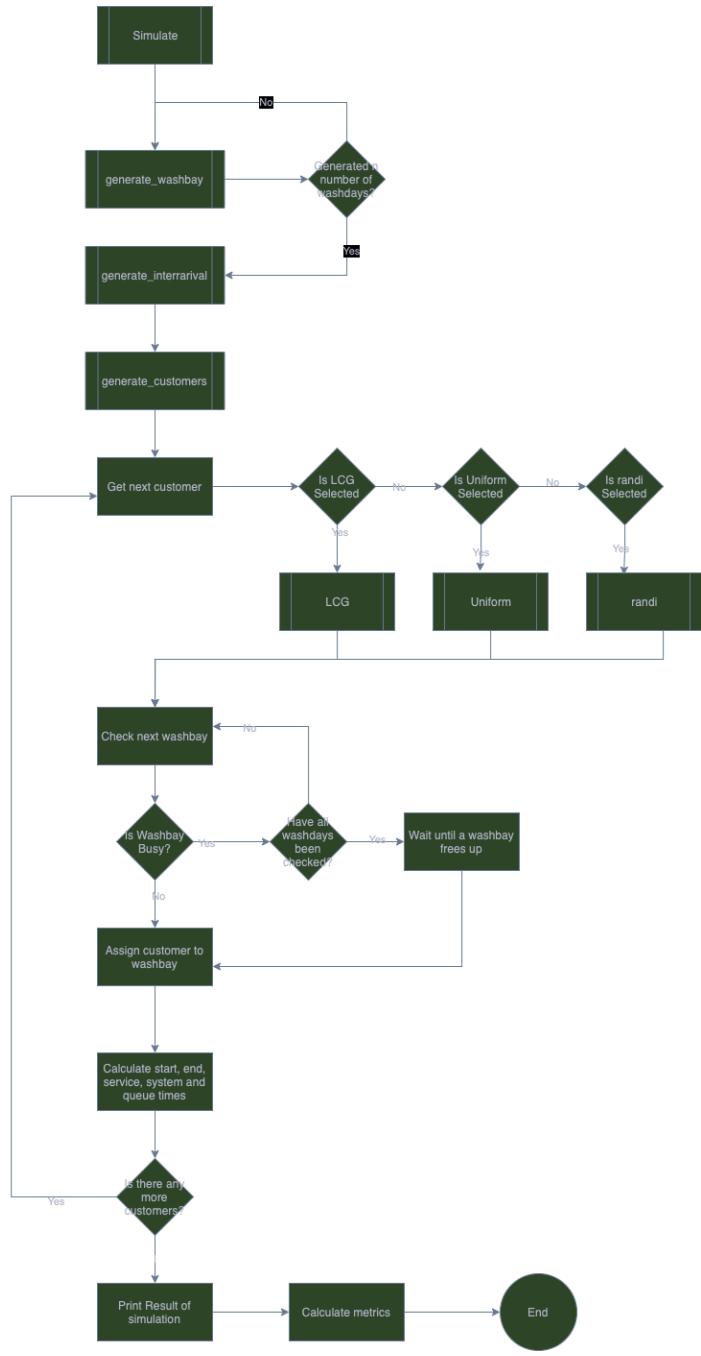

1. main.m:
 - o This part of the code accepts input from the user regarding the parameters with which the simulation should run
 - o It validates user input
2. simulate.m:
 - o Contains the main code for the initialization and running of the simulation, and is the code responsible for calculating arrival times, service times, and other relevant metrics for each customer.
3. print_table.m:
 - o prints a matrix as a table, this is used for both the washbay distribution as well as the interarrival distribution
 - o It displays service times, probabilities, cumulative distribution functions (CDFs), and ranges.
4. LCG.m:
 - o Linear Congruential Generator (LCG) algorithm.
 - o used to generate pseudo-random numbers based on a linear equation.
 - o The parameters (seed, multipliers, modulus) determine the sequence of random numbers.
5. Uniform.m
 - o Generates uniformly generated random numbers
6. get_value.m:
 - o find the corresponding value based on a random number within specified ranges.
 - o mapping random numbers to specific service times or interarrival times.
7. generate_washbays.m:
 - o generates data for wash bays in a car wash system
 - o define service times and probabilities for each wash bay.
 - o The data is structured in a 3D matrix, where each slice corresponds to a different wash bay.
8. generate_interarrival.m:
 - o generates interarrival time data for customers.
 - o initialize an interarrival matrix with predefined values.

- The third and fourth columns represent cumulative probabilities and ranges for interarrival times.
9. generate_customers.m:
- generates customer data.
 - create a matrix customers with columns for customer number, random numbers, and additional information.

3 Process Flow

This is the flow chart describing the flow fo the program as it takes inputs from the user. The validation decision is left out of this diagram for brevity and readability, and as it is not the main focus of the task.

This is the more important flowchart, discussing the `simulate.m` function, which takes given parameters from main and actually runs the simulation.

1. Main (user input):

- Prompt the user to enter the number of cars as well as the number of washbays
- Validate the input (ensure the number of cars is greater than or equal to 2).
- Prompt the user to choose the random number generator type (either LCG or Uniform Distribution).
- Validate the input (type should be the name of the method).

2. Simulation - Random Number Generation:

- Generate the interarrival distribution
- Generate the distribution for each of the washbays
- Based on the chosen type:
 - Generate random numbers for interarrival times (time between car arrivals).
 - Generate random numbers for service types (washing only or washing and polishing).

Interarrival Times:				
Service Time	Prob.	CDF	Range	
2	0.30	0.30	1- 30	
3	0.40	0.70	31- 70	
4	0.30	1.00	71-100	

Wash Bay 1:			
Service Time	Prob.	CDF	Range
10	0.40	0.40	1- 40
15	0.30	0.70	41- 70
20	0.30	1.00	71-100

Wash Bay 2:			
Service Time	Prob.	CDF	Range
10	0.40	0.40	1- 40
15	0.30	0.70	41- 70
20	0.30	1.00	71-100

Wash Bay 3:			
Service Time	Prob.	CDF	Range
10	0.40	0.40	1- 40
15	0.30	0.70	41- 70
20	0.30	1.00	71-100

3. Simulation - Calculate Arrival Times:

- Based on the numbers randomly generated, map each of the random numbers to a value in the domain of the interarrival distribution
- Calculate the actual arrival times of cars using the generated inter-arrival times.

4. Determine the washbay for each customer:

- For each car:
 - Determine if there's any free washbays that are available
 - If a wash bay is available:
 - Assign the car to that bay.
 - Calculate the service time based on the service type.
 - Update the end time of the wash bay.
 - If no wash bay is available:
 - Calculate the waiting time for each wash bay.
 - Assign the car to the bay with the shortest waiting time.
 - Make car wait until that washbay is free
 - Update relevant information:
 - Waiting time for the car.
 - Service start time.
 - Service end time.
 - Total time spent in the system (arrival to departure).
 - Print relevant information about the car's arrival, service, and departure.

5. Result Calculation:

- Calculate the following metrics for each wash bay:
 - Average waiting time.

- Average inter-arrival time.
- Average arrival time.
- Average time spent in the system.
- Probability of waiting in the queue.
- Average service times.

6. Output Results:

- Display the calculated results in the form of tables or other visualizations to simulate the car wash process.

Simulation:													
No.	Rn	Arrival	Interarrival	Arrival	Rn	Service	Washbay 1			Washbay 2			S
							Start	End	Service	System	Queue	Start	End
1	56	3	0	16	1	1	0	10	10	0	0	0	0

10	51	3	29	87	3	3	0	0	0	0	0	0	0

4 Implementation

4.1 generate_washbays

<u>Code</u>	<u>Explanation</u>
<pre>1 function [washbays] = generate_washbays(count) 2 washbays = zeros(3, 2, count); 3 for i = 1:count 4 washbays(:,:,i) = [5 10, 0.4 ; 6 15, 0.3 ; 7 20, 0.3 8]; 9 end 10 11 for i = 1:count 12 for j = 1:3 13 washbays(j,3,i) = sum(washbays(1:j,2,i)); 14 if j > 1 15 washbays(j,4,i) = washbays(j-1,5,i) + 1; 16 washbays(j,5,i) = washbays(j,4,i) + 100*washbays(j,2,i) - 1; 17 else 18 washbays(j,4,i) = 1; 19 washbays(j,5,i) = 100*washbays(j,2,i); 20 end 21 end 22 end 23 return; 24 end</pre>	<ul style="list-style-type: none">Takes one parameter, which is count (the number of washbays to generate)It generates a 3D matrix to store each of the washbay tablesThe For loop at the end is responsible for getting the CDF as well as calculate the ranges for each row

4.2 generate_interrival

<u>Code</u>	<u>Explanation</u>
<pre>1 function [interarrival] = generate_interarrival(count=3) 2 interarrival = [3 2 0.3 0 0 0; 4 3 0.4 0 0 0; 5 4 0.3 0 0 0; 6]; 7 8 for i = 1:count 9 interarrival(i,3) = sum(interarrival(1:i,2)); 10 if i > 1 11 interarrival(i,4) = interarrival(i-1,5) + 1; 12 interarrival(i,5) = interarrival(i,4) + 100*interarrival(i,2) - 1; 13 else 14 interarrival(i,4) = 1; 15 interarrival(i,5) = 100*interarrival(i,2); 16 end 17 end</pre>	This, like the generate_washbay function, generates the distribution table for the interarrival time for the customers. This time it is in a 2D array because we only need one of this distribution table. It takes

generate_random

<u>Code</u>	<u>Explanation</u>
<pre> 1 function [random_number] = generate_random(first=0, last=100,n=10, method='LCG') 2 disp(method); 3 switch method 4 case 'LCG' 5 random_number = LCG(100, 232, 100, n); 6 case 'uniform' 7 random_number = uniform(210, 89, n); 8 case 'randi' 9 for i = 1:n 10 random_number(i) = randi([first, last]); 11 end 12 otherwise 13 disp('Invalid method'); 14 end </pre>	<p>This function takes 4 parameters, the first and last, which are the bounds for the random numbers generated, n, which is the number of random numbers to generate, initialized to 10 and the method, which is initialized to 'LCG'. This function checks the required method, and then calls the appropriate function to generate the random numbers.</p>

4.3 LCG

<u>Code</u>	<u>Explanation</u>
<pre> 1 % 1 function [random_numbers]= LCG(m, a, c, n) 2 % Linear Congruential Generator 3 % seed: initial seed value 4 % m: modulus 5 % a: multiplier 6 % c: increment 7 % n: number of random numbers to generate 8 9 % Initialize the random numbers array 10 random_numbers = zeros(1, n); 11 12 % Initialize the seed 13 seed = randi([1, 100]); 14 15 % Generate n random numbers 16 for i = 1:n 17 % Generate the next random number 18 x = mod(a*seed + c, m); 19 20 % Store the random number 21 random_numbers(i) = x; 22 end 23 end </pre>	<ul style="list-style-type: none"> The LCG function generates pseudo-random numbers using the Linear Congruential Generator algorithm. It takes parameters such as seed, multipliers (a), increment (c), modulus (m), and the number of random numbers to generate (n).

4.4 get_value

Code	Explanation
<pre>7 function val = get_value(rn, ranges) 8 for i = 1:size(ranges, 1) 9 if rn >= ranges(i,2) && rn <= ranges(i,3) 10 val = ranges(i,1); 11 return ; 12 end 13 end 14 15 end</pre>	This function takes 2 parameters, the random number, and the set of ranges to check it against. This function is responsible for mapping each random number to the distribution table so that it is mapped to the correct domain of values.

main.m

```
1 function main()
2 % Get customer count from user
3 customer_count = input('Enter the number of customers(>2): ');
4 if customer_count < 2
5     disp('Invalid customer count. Please enter a number greater than 2.');
6     return;
7 end
8 % Get washbay count from user
9 washbay_count = input('Enter the number of washbays(<5): ');
10
11 if washbay_count > 5 || washbay_count < 1
12     disp('Invalid washbay count. Please enter a number between 1 and 5.');
13     return;
14 end
15 % Get method from user
16 disp('Enter the method to generate random numbers:');
17 disp('1. LCG (Linear Congruential Generator)');
18 disp('2. uniform (Uniform Distribution)');
19 disp('3. randi (Inbuilt Random Integer Generation Function)');
20
21 method = input('Enter the method to generate random numbers: ', 's');
22
23
24 if strcmp(method, 'LCG') == 0 && strcmp(method, 'uniform') == 0 && strcmp(method, 'randi') == 0
25     disp('Invalid method. Please enter a valid method.');
26     return;
27 end
28
29 simulate( washbay_count, customer_count, method);
30 end
```

Explanation

This is the main function that takes input from the user and validates it before running the simulation.

4.5 print_table.m

<u>Code</u>	<u>Explanation</u>
<pre> 1 % function print_table(mat) 2 % Display a matrix as a table 3 % Input: mat - the matrix to display as a table 4 5 % Check if input is a matrix 6 if ~ismatrix(mat) 7 error('Input must be a matrix'); 8 end 9 10 % Print the header 11 printf('Service Time\tProb.\tCDF\tRange\n'); 12 printf('-----\t-----\t-----\n'); 13 14 % Get the size of the matrix 15 [rows, cols] = size(mat); 16 17 % Print the header row 18 19 % Print the matrix as a table 20 for i = 1:rows 21 printf('%3d\t%1.2f\t%1.2f\t%3d-%3d', mat(i,1), mat(i,2), mat(i,3), mat(i,4), mat(i,5)); 22 printf('\n'); 23 end 24 end </pre>	<p>This function is responsible for taking the distribution tables we created for the washbays as well as the interarrival times as matrices and prints them out in a pretty print table.</p>

4.6 simulate.m

<u>Code</u>	<u>Explanation</u>
<pre> function simulate(washbay_count=3, customer_count=10, method='LGS') % This function simulates the arrival of customers, their service times, and interarrival times, and creates customer % washbays = generate_washbays(washbay_count); % Create a matrix to store the simulation results simulation = zeros(customer_count, 5 + washbay_count)*5; t = 0; % Initialize the time for i = 1:washbay_count simulation(i,1) = i; % Customer count simulation(i,2) = generate_random(1,100, customer_count, method); % Random Number for Service Time simulation(i,3) = generate_random(1,100, customer_count, method); % Random Number for Interarrival simulation(i,4) = t; % Arrival time t = t + simulation(i,3); % Arrival time end % Assign the customer to a wash bay based on the wash bay with the earliest end time for j = 1:washbay_count max_end_time = max(simulation(:,[8 + 5*(j-1)])); % We are looking for the earliest end time, by using the max function we can find the earliest end time end_idx = find(simulation(:,8 + 5*(j-1)) == max_end_time); % Get the wash bay with the earliest end time by its index simulation(end_idx,5) = j; % Assign the customer to the wash bay simulation(i,6) = washbay_idx; duration = get_value(simulation(i,5), washbay_idx, [1,4,5], washbay_idx); % Service Time printf('Customer %d arrives at %d and is assigned to Wash Bay %d\n', i, simulation(i,4), washbay_idx); printf('Customer %d departs at %d\n', i, simulation(i,4) + duration); if i == 1 % It is the first iteration, don't look for previous end times simulation(i,(washbay_idx-1)*5+7) = simulation(i,4); % Start Time else % It is not the first iteration, look at the previous end times simulation(i,(washbay_idx-1)*5+7) = max(simulation(:, (washbay_idx-1)*5+8)); % Start Time end simulation(i,(washbay_idx-1)*5+8) = simulation(i,(washbay_idx-1)*5+7) + duration; % End Time calculated by adding the start time and the duration simulation(i,(washbay_idx-1)*5+9) = duration; % Duration Time calculated by the start time and the end time simulation(i,(washbay_idx-1)*5+10) = simulation(i,(washbay_idx-1)*5+9) - simulation(i,4); % Arrival Time calculated by the start time and the arrival time simulation(i,(washbay_idx-1)*5+11) = max(0, simulation(i,(washbay_idx-1)*5+9) - simulation(i,4) - simulation(i,4)); % Queue Time calculated by the start time and the arrival time simulation(i,(washbay_idx-1)*5+12) = duration + simulation(i,(washbay_idx-1)*5+11); % System Time calculated by the start time and the arrival time end </pre>	<p>This is the function responsible for running the simulation and takes 3 parameters, the number of washbays, the customer count and the method to use for random number generation. It calls most of the previous function defined to execute various parts of the simulation and finally prints the output.</p>

```

1 printf('\nWash Bay %2d:\n', 1);

Second Run

Number of customers:15

Number of washbays: 4

Method: uniform

```
Octave:3@2> main
Enter the number of customers(>2): 15
Enter the number of washbays(<5): 4
Enter the method to generate random numbers:
1. LCG (Linear Congruential Generator)
2. uniform (Uniform Distribution)
3. randi (Inbuilt Random Integer Generation Function)
Enter the method to generate random numbers: uniform
```

```
Customer 1 arrives at 0 and is assigned to Wash Bay 1
Customer 1 departs at 10
Customer 2 arrives at 4 and is assigned to Wash Bay 2
Customer 2 departs at 19
Customer 3 arrives at 8 and is assigned to Wash Bay 3
Customer 3 departs at 18
Customer 4 arrives at 11 and is assigned to Wash Bay 4
Customer 4 departs at 21
Customer 5 arrives at 15 and is assigned to Wash Bay 1
Customer 5 departs at 25
Customer 6 arrives at 18 and is assigned to Wash Bay 3
Customer 6 departs at 33
Customer 7 arrives at 22 and is assigned to Wash Bay 2
Customer 7 departs at 37
Customer 8 arrives at 25 and is assigned to Wash Bay 4
Customer 8 departs at 35
Customer 9 arrives at 27 and is assigned to Wash Bay 1
Customer 9 departs at 47
Customer 10 arrives at 30 and is assigned to Wash Bay 3
Customer 10 departs at 45
Customer 11 arrives at 34 and is assigned to Wash Bay 4
Customer 11 departs at 44
Customer 12 arrives at 38 and is assigned to Wash Bay 2
Customer 12 departs at 58
Customer 13 arrives at 41 and is assigned to Wash Bay 4
Customer 13 departs at 56
Customer 14 arrives at 45 and is assigned to Wash Bay 1
Customer 14 departs at 55
Customer 15 arrives at 48 and is assigned to Wash Bay 3
Customer 15 departs at 58
